1. Don’t routinely suggest antimicrobial treatment for older persons unless they are consistent with their goals of care.

While antimicrobial treatments can be lifesaving, they are not without side-effects, particularly for an older person. Antimicrobial use is only appropriate if it aligns with the older person’s wishes and goals of care. Life-prolonging use of antimicrobials may be inconsistent with a patient’s wishes or a palliative approach to care. Talk with the older person and their family to ensure they understand the impact of antimicrobial treatment.

2. Don’t routinely use intravenous antimicrobials for older persons who can take and absorb oral medications.

When antimicrobials are indicated and consistent with an older person’s plan of care, intravenous formulations should not be the first choice unless there is no other safe and effective route of administration. Many antimicrobials have excellent bioavailability and only in rare instances need to be administered intravenously. Use of oral formulations of these medications reduces the need for placement and maintenance of venous access devices and their associated complications. In addition, reduced need for venous access can prevent transfer of an older person away from their current setting to accommodate a higher level of care.

3. Don’t send frail older persons to the hospital unless their urgent needs and goals of care cannot be met in their current setting.

Transfers to hospital for assessment and treatment of a change in condition have become customary. However, harms can outweigh benefit and may result in increased morbidity. In one Canadian study, approximately half of hospitalizations were considered avoidable. Transfer often results in long periods in an unfamiliar and stressful environment for the older person. Other hazards include delirium, hospital-acquired infections, medication side effects, lack of sleep, and rapid loss of muscle strength while bedridden. Frail older persons assessed and treated in their current settings have the opportunity to receive more individualized care and better comfort and end-of-life care. If a transfer is unavoidable, a person-centred collaborative approach is necessary to communicate the older person’s functionality and plan of care to ensure their needs are met. Much consideration should be given to the older person’s goals of care, including integrating a palliative approach to care.

4. Don’t encourage bed rest for older persons during a hospital stay unless medically indicated.

Continuous bed rest or limited ambulation during a hospital stay causes deconditioning and loss of muscle mass and is one of the primary factors for loss of walking independence in hospitalized older adults. Up to 65% of older persons who can walk independently will lose this ability during a hospital stay. Walking during the hospital stay is critical for maintaining this functional ability. Loss of walking independence increases the length of hospital stay, the need for rehabilitation services, the possibility of placement in a nursing home, and the risk for falls both during and after discharge from the hospital. It also places higher demands on caregivers and increases the risk of death. Compared with older persons who don’t walk during their hospital stay, those that do are able to walk farther by discharge, are discharged from the hospital sooner, have improved ability to perform basic daily living tasks independently, and have a faster recovery rate after surgery.
**Don't use restraints with older persons unless all other alternatives have been explored.**

Restraints are most often applied when an older person is distressed or has a change in medical status. These situations require immediate assessment and attention, not restraint. Restraints can be mechanical, physical, chemical or environmental in nature — for example, devices or medications that can be used to restrict a person's movement. Perceived benefits of restraints are often outweighed by their significant potential for harm, including serious complications and even death. Safe, quality care can be achieved using a least-restraint approach.

**Don't use a q2h turning routine unless it meets the older person's plan of care.**

Individualized turning plans should be developed to align with the older person's care needs. Turning an older person q2h is often considered the gold standard implemented in many areas of health care to aid in the avoidance of skin breakdown and pressure injuries. However, there is little evidence to support this particular frequency of repositioning. In some cases, it is far too frequent; in others, it is not frequent enough. For older persons at low risk for skin breakdown, this practice may severely impact their quality of life due to sleep deprivation and disruption, leading to delirium, depression and other psychiatric impairments. Excessive repositioning of an older adult may also result in shearing forces that can lead to pressure injuries. Conversely, q2h turning may be inadequate for persons at higher risk for skin breakdown, including those with decreased tissue tolerance and limited mobility. To facilitate an appropriate turning schedule for older adults of all risk levels, it is crucial to use a validated tool to assess each client's risk for skin breakdown and develop an individualized turning plan.
How the list was created
The Canadian Nurses Association (CNA) and the Canadian Gerontological Nursing Association (CGNA) established its Choosing Wisely Canada nursing list by convening an 11 member nursing working group (NWG). The group consisted of gerontological nursing experts from across Canada, representing a broad range of geographical regions and practice settings. The NGW began considering its list by reviewing existing recommendations, including items from Choosing Wisely Canada’s specialty societies and the American Academy of Nursing (AAN) Choosing Wisely list, both of which had already undergone rigorous evidence reviews. In addition, members brought forward recommendations on new evidence-based items. The NGW appraised 260 items for their relevance to gerontological nursing using a structured process developed for this work. Each of these items (227 Choosing Wisely Canada items, 20 AAN Choosing Wisely items and 13 independently-submitted items) was appraised by two independent reviewers and then validated by the group. Using a modified Delphi process for the next two rounds of revision, the group refined and adapted 17 items until it reached consensus on a final six-item list. A literature review was conducted to confirm the evidence for these items, and supporting nursing research was added where appropriate. The list subsequently underwent extensive consultation, with input from nursing experts in patient safety, members of the Canadian Network of Nursing Specialties, patient advocates, CNA jurisdictional members, CNA nurses, principal nurse advisors, the Canadian Agency for Drugs and Technologies in Health (CADTH) and Choosing Wisely Canada’s internal clinician reviewers. In March of 2018, the Choosing Wisely Canada gerontological nursing list was presented to the CGNA executive and CNA board, both of whom gave it their full endorsement and support.

About the Canadian Nurses Association
The Canadian Nurses Association is the national and global professional voice of Canadian nursing, representing over 139,000 registered nurses and nurse practitioners in Canada. CNA advances the practice and profession of nursing to improve health outcomes and strengthen Canada’s publicly funded, not-for-profit health system.

About the Canadian Gerontological Nursing Association
The Canadian Gerontological Nursing Association is an organization that represents gerontological nurses and promotes gerontological nursing practice across national and international boundaries. The vision of CGNA is to promote excellence in gerontological nursing through leadership, knowledge, and scholarship. CGNA’s mission is to address the health concerns of older Canadians and the nurses who participate with them in health care.

About Choosing Wisely Canada
Choosing Wisely Canada is the national voice for reducing unnecessary tests and treatments in health care. One of its important functions is to help clinicians and patients engage in conversations that lead to smart and effective care choices.
